WebRTC

The WebRTC (Web Real-Time Communication) technology developed in open code by Google allows communication for video and audio in real time through the Web browser without the need to install any plug-in or external program.

At Neotel we use this programming interface to implement our WebRTC line, which, unlike many of our competitors, will allow you to have a high-performance softphone with the ability to transfer calls and make a conference call in any browser. In this way you will save facilities or complex configurations that other softphones require, since ours will be ready to be used with a couple of clicks.

Enjoy the convenience of being able to call from any device with an Internet connection with this system implanted for free in our CRM and in our Virtual Switchboard.

WebRTC

| Web Realtime-Communication

Neotel offers a high-performance softphone with the ability to transfer calls and make multiconferences from your browser.

AT NO
ADDITIONAL COST

Own development tool based on Google technology.
